

What is a Database?

- Collection of data central to some enterprise
- Essential to operation of enterprise
 - Contains the only record of enterprise activity
- An asset in its own right
 - Historical data can guide enterprise strategy
 - Of interest to other enterprises
- State of database mirrors state of enterprise
 - Database is persistent

What is a Database Management System?

- A Database Management System (DBMS) is a program that manages a database:
 - Supports a high-level access language (e.g. SQL).
 - Application describes database accesses using that language.
 - DBMS interprets statements of language to perform requested database access.

What is a Transaction?

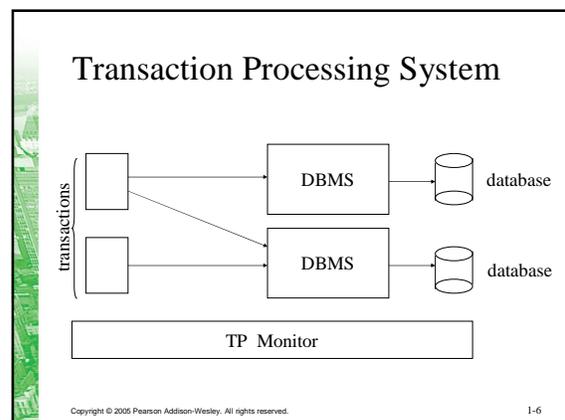

- When an event in the real world changes the state of the enterprise, a transaction is executed to cause the corresponding change in the database state
 - With an on-line database, the event causes the transaction to be executed in real time
- A transaction is an application program with special properties - discussed later - to guarantee it maintains database correctness

What is a Transaction Processing System?

- Transaction execution is controlled by a TP monitor
 - Creates the abstraction of a transaction, analogous to the way an operating system creates the abstraction of a process
 - TP monitor and DBMS together guarantee the special properties of transactions
- A Transaction Processing System consists of TP monitor, databases, and transactions

System Requirements

- **High Availability:** on-line => must be operational while enterprise is functioning
- **High Reliability:** correctly tracks state, does not lose data, controlled concurrency
- **High Throughput:** many users => many transactions/sec
- **Low Response Time:** on-line => users are waiting

1-7

System Requirements (con't)

- **Long Lifetime:** complex systems are not easily replaced
 - Must be designed so they can be easily extended as the needs of the enterprise change
- **Security:** sensitive information must be carefully protected since system is accessible to many users
 - Authentication, authorization, encryption

1-8

Roles in Design, Implementation, and Maintenance of a TPS

- **System Analyst** - specifies system using input from customer; provides complete description of functionality from customer's and user's point of view
- **Database Designer** - specifies structure of data that will be stored in database
- **Application Programmer** - implements application programs (transactions) that access data and support enterprise rules

1-9

Roles in Design, Implementation and Maintenance of a TPS (con't)

- **Database Administrator** - maintains database once system is operational: space allocation, performance optimization, database security
- **System Administrator** - maintains transaction processing system: monitors interconnection of HW and SW modules, deals with failures and congestion

1-10

OLTP vs. OLAP

- **On-line Transaction Processing (OLTP)**
 - Day-to-day handling of transactions that result from enterprise operation
 - Maintains correspondence between database state and enterprise state
- **On-line Analytic Processing (OLAP)**
 - Analysis of information in a database for the purpose of making management decisions

1-11

OLAP

- Analyzes historical data (terabytes) using complex queries
- Due to volume of data and complexity of queries, OLAP often uses a data warehouse
- **Data Warehouse** - (offline) repository of historical data generated from OLTP or other sources
- **Data Mining** - use of warehouse data to *discover* relationships that might influence enterprise strategy

1-12

Examples - Supermarket

- OLTP
 - Event is 3 cans of soup and 1 box of crackers bought; update database to reflect that event
- OLAP
 - Last winter in all stores in northeast, how many customers bought soup and crackers together?
- Data Mining
 - Are there any interesting combinations of foods that customers frequently bought together?
